INTRODUCTION

The power factor of induction motors varies with load, typically from around 0.85 or 0.90 at full load to as low as 0.12 without load, due to stator and rotor leakage and magnetizing reactance. Power factor can be improved by connecting capacitors either on an individual motor basis or, by preference, on a common bus covering several motors. For economic and other considerations, power systems are rarely power factor corrected to unity power factor.
